Road map

- **Number systems**
- Complements
- Miscellaneous things

Number systems

十進位

- Decimal numbers: $7397 = 7 \times 10^3 + 3 \times 10^2 + 9 \times 10^1 + 7 \times 10^0$.
- In general,

$$a_3 a_2 a_1 a_0 . a_{-1} a_{-2}$$
$$= a_3 \times 10^3 + a_2 \times 10^2 + a_1 \times 10^1 + a_0 \times 10^0 + a_{-1} \times 10^{-1} + a_{-2} \times 10^{-2}.$$

  - a_i: **coefficient**.
  - 10: **base** or **radix**. 以10為基準
  - a_3: most significant bit (**msb**). 影響力最大 (msb)
  - a_{-2}: least significant bit (**lsb**). 影響力最小 (lsb)

Base-r system

- In general, number X in a **base-r system** is represented as 標示幾進位

$$X = (a_n a_{n-1} \cdots\cdots a_1 a_0 . a_{-1} a_{-2} \cdots\cdots a_{-m})_r.$$

- Its value in the base-~~10~~ r system is

$$X = a_n r^n + a_{n-1} r^{n-1} + \cdots + a_1 r + a_0 + a_{-1} r^{-1} + a_{-2} r^{-2} + \cdots + a_{-m} r^{-m}.$$

  - In a **binary** system, $r = 2, a_i \in \{0,1\}$. binary 二進位
  - In an **octal** system, $r = 8, a_i \in \{0,1, \ldots, 7\}$. octal 八進位
  - In a **decimal** system, $r = 10, a_i \in \{0,1, \ldots, 9\}$. decimal 十進位
  - In a **hexadecimal** system, $r = 16, a_i \in \{0,1, \ldots 9, A, B, C, D, E, F\}$.

    hexadecimal 十六進位

Base conversion

- Base-*r* to base-10 conversion: Straightforward！
- Base-*r* to base-*s* conversion: By **repeated division for integers** and **repeated multiplication for fractions**. 整數反覆做除法，小數反覆做乘法
- **Example.** Converting $(153.513)_{10}$ to an octal number.
  Integer part: $(153)_{10} = (231)_8$. octal 八進位

		餘數 remainder
8	153	
8	19	1
	2	3

$153 \div 8 = 19 \ldots 1$

$19 \div 8 = 2 \ldots 3$

$\Rightarrow (231)_8$

$2 \times 8^2 + 3 \times 8^1 + 1 \times 8^0$

$= 128 + 24 + 1 = 153$

Base conversion

$(0.5)_{10進位} = (0.4)_{8進位}$

$5 = 10 \div 2$ $4 = 8 \div 2$

10進位的一半 = 8進位的一半

$(0.5)_{10} = (0.4)_8$

- fractional part: 0.513
  - $0.513 \times 8 = \mathbf{4}.104.$
  - $0.104 \times 8 = \mathbf{0}.832.$
  - $0.832 \times 8 = \mathbf{6}.656.$
  - $0.656 \times 8 = \mathbf{5}.24.$
  - …
- $(0.513)_{10} \approx (0.\mathbf{4065})_8$
- All together:

$$(153.513)_{10} \approx (231.4065)_8.$$

General base conversion: integer part

- $X = a_n r^n + a_{n-1} r^{n-1} + \cdots + a_1 r + a_0 + a_{-1} r^{-1} + a_{-2} r^{-2} + \cdots + a_{-m} r^{-m}$.
- Consider the integer part: $XI = a_n r^n + a_{n-1} r^{n-1} + \cdots + a_1 r + a_0$.
- By dividing XI by r, we obtain

$$\frac{XI}{r} = a_n r^{n-1} + a_{n-1} r^{n-2} + a_{n-2} r^{n-3} + \cdots + a_2 r + a_1,$$

  – The **remainder** is $\boldsymbol{a_0}$.
- By dividing XI/r by r, we obtain

$$\frac{XI}{r^2} = a_n r^{n-2} + a_{n-1} r^{n-3} + \cdots + a_3 r + a_2,$$

  – The **remainder** is $\boldsymbol{a_1}$.

General base conversion: integer part

- By dividing XI/r^2 by r, we obtain

$$\frac{XI}{r^3} = a_n r^{n-3} + a_{n-1} r^{n-4} + \cdots + a_4 r + a_3,$$

  – The **remainder** is $\boldsymbol{a_2}$.

- Continually in this fashion, we eventually obtain the coefficients

$$a_n\, a_{n-1} a_{n-2} \cdots a_1 a_0.$$

$$8\overline{)251} \quad 3$$
$$8\overline{)31} \quad 7$$
$$3$$

$$(251)_{10} = (373)_8$$

General base conversion: fraction part

- Consider the faction part:

$$XF = a_{-1}r^{-1} + a_{-2}r^{-2} + \cdots + a_{-m}r^{-m}.$$

- By multiplying XF by r, we obtain

$$XF \cdot r = \underbrace{\boldsymbol{a_{-1}} +}_{\substack{\text{integer in between} \\ 0 \cdots r-1}} \underbrace{a_{-2}r^{-1} + a_{-3}r^{-2} + \cdots + a_{-m+1}r^{-m+2} + a_{-m}r^{-m+1}}_{<1}.$$

Because the maximum value of this part is

$$(r-1)r^{-1} + (r-1)r^{-2} + \cdots + (r-1)r^{-m+2} + (r-1)r^{-m+1}$$

$$\leq (r-1)\left(r^{-1} + r^{-2} + r^{-3} + \cdots + r^{-m+1}\right)$$

$$< (r-1)\left(\frac{1}{r-1}\right) = 1.$$

General base conversion: fraction part

- By continually multiplying the fraction part of $XF \times r$, we obtain

$$XF_1 = \underbrace{a_{-2}}_{\substack{\text{integer in between} \\ 0 \cdots r-1}} + \underbrace{a_{-3}r^{-1} + \cdots + a_{-m+1}r^{-m+3} + a_{-m}r^{-m+2}}_{<1}.$$

  So we obtain the **second digit** a_{-2}.

- Similarly, by continually multiplying the fraction part of XF_1, we can obtain the third digit a_{-3}, then a_{-4}, then a_{-5}, and so on.

Base 2^i to base 2^j

- Conversion between **base 2^i and base 2^j** can be done more quickly.
- **Example.** Convert $(10111010011)_2$ to octal and hexadecimal:

8進位 16進位

3個1組 4個1組

$$10111010011 \Rightarrow \underset{2}{\underline{10}}\ \underset{7}{\underline{111}}\ \underset{2}{\underline{010}}\ \underset{3}{\underline{011}} \Rightarrow (2\ 7\ 2\ 3)_8$$

$$10111010011 \Rightarrow \underset{5}{\underline{101}}\ \underset{D}{\underline{1101}}\ \underset{3}{\underline{0011}} \Rightarrow (5\ D\ 3)_{16}$$

☆ 16進位：0 ~ 9，A B C D E F
10 11 12 13 14 15

$2^3\times1+2^2\times1+0+2^0\times1$
$= 8+4+0+1$
$= 13$

Base 2^i to base 2^j

- **Example.** Convert $(12A7F)_{16}$ to binary and octal.

二進位 八進位

$$(12A7F)_{16} \Rightarrow (0001\ 0010\ 1010\ 0111\ 1111)_2$$

$$\Downarrow$$

$$(00\ \underset{2}{\underline{010}}\ \underset{2}{\underline{010}}\ \underset{5}{\underline{101}}\ \underset{1}{\underline{001}}\ \underset{7}{\underline{111}}\ \underset{7}{\underline{111}})_2 \Rightarrow (2\ \ 2\ 5\ 1\ 7\ 7)_8$$

Road map

- Number systems
- **Complements**
- Miscellaneous things

Addition/subtraction for binary numbers

減法

- In our **mind**, **subtraction** appears to take a different approach from **addition**.
- The difference will complicate the design of a logical circuit.

Addition

二進位的加法

$$\begin{array}{r} 9 \\ +\ 13 \\ \hline 22 \end{array} \qquad \begin{array}{r} 1001 \\ +\ 1101 \\ \hline 10110 \end{array}$$

減法

Subtraction

$$\begin{array}{r} 9 \\ -\ 13 \\ \hline -\ 4 \end{array} \qquad \begin{array}{r} 1001 \\ -\ 1101 \\ \hline ? \end{array}$$

負 數

- The problem can be solved if we can represent "negative" numbers so that subtraction becomes **addition to a negative number**. 減法 = 加上負數
- How may we represent negative numbers with just 0s and 1s?

Signed magnitude

0	0000 0000
1	0000 0001
2	0000 0010
	…
127	0111 1111

all positive numbers begin with 0

−127	1111 1111
	…
−2	1000 0010
−1	1000 0001
−0	1000 0000

all negative numbers begin with 1

Subtraction: signed-magnitude numbers

$$\begin{array}{r} +\ 9 \\ +\ 13 \\ \hline +\ 22 \end{array} \Rightarrow \begin{array}{r} 00001001 \\ +\ 00001101 \\ \hline 00010110 \end{array}$$

$$\begin{array}{r} -\ 9 \\ +\ 13 \\ \hline +\ 4 \end{array} \Rightarrow \begin{array}{r} 10001001\ ① \\ +\ 00001101\ ② \\ \hline \end{array}$$

∵|②|>|①| 且①為負數
∴調換位置
用大減小

$$\Rightarrow \begin{array}{r} 00001101 \\ -\ 00001001 \\ \hline 00000100 \end{array}$$

$$\begin{array}{r} +\ 9 \\ -\ 13 \\ \hline -\ 4 \end{array} \Rightarrow \begin{array}{r} 00001001\ ① \\ +\ 10001101\ ② \\ \hline \end{array}$$

∵|②|>|①|
且②<0
∴②上移且
保留負數(1開頭)
且做減法

$$\Rightarrow \begin{array}{r} 10001101 \\ -\ 00001001 \\ \hline 10000100 \end{array}$$

Subtraction: signed-magnitude numbers

$$\begin{array}{r} -\ 9 \\ -\ 13 \\ \hline -\ 22 \end{array} \quad \Rightarrow \quad \begin{array}{r} 10001101 \\ +\ 10001001 \\ \hline 10010110 \end{array}$$

Summary： 算術 有符号的

to perform arithmetic operations on signed magnitude numbers, we need to compare the signs and the magnitudes of the two numbers, and then perform either addition or subtraction, much like what we were taught to do in primary school. So **this does not simplify the problem**.

減法

簡化

Complement: for simplifying subtraction

補數 簡化 減法

- Two types of complements for each base-r system：
  - **$(r-1)$'s complement**.
  - **r's complement**.
- The $(r-1)$'s complement of an n-digit number $X = (r^n - 1) - X$.

n位數

十進位

- **Example.** In a decimal system, the 9's complement of 546700 is

加起來要是9

546700為六位數

$$(10^6 - 1) - 546700 = 999999 - 546700 = 453299.$$

- **Example.** The 9's complement of 012398 is $999999 - 012398 = 987601$.
- **Example.** The 1's complement of 01011000 is

$$(2^8 - 1) - 01011000 = 11111111 - 01011000 = 10100111.$$

- **Example.** The 1's complement of 0101101 is 1010010.

8-bit 1's complement numbers

(r−1)'s complement

−0	1111 1111

all positive numbers begin with 0

所有的正數開頭為0

all negative numbers begin with 1

所有的負數開頭為1

r's complement

* (r-1)'s complement: $(r^n - 1) - X$
r's complement: $r^n - X$
∴ r's complement = (r-1)'s complement +1

- The *r*'s complement of an *n*-digital number X is $\begin{cases} r^n - X & \text{if } X \neq 0 \\ 0 & \text{if } X = 0 \end{cases}$.
- **Example.**
  - The 10's complement of 012398 is 987602.
  - The 10's complement of 2467000 is 7533000.
  - The 2's complement of 1101100 is 0010100.
  - The 2's complement of 0110111 is 1001001.

<法一> 987601 +1 →
<法二> 10's complement ; 2's complement
藍色部分加起來要等於 9 ; 1
紅色部分加起來要等於 10 ; 2
最後面的 0 放著不管
<法二> 先想 (r-1)'s complement 再 +1
7532999 +1 →
0010011 +1 →
1001000 +1 →

- To compute the complement of a number having radix point, first, **remove the radix point**, compute the complement of the new number, and **restore the radix point**.
  - The 1's complement of 01101.101 is 10010.010
  - The 2's complement of 01101.101 is 10010.011

(r-1)'s complement
10010.010
r's complement
10010.010 +1 = 10010.011

8-bit 2's complement numbers

1's complement

0	0000 0000
1	0000 0001
2	0000 0010
	...
127	0111 1111
−128 ?	1000 0000
−127	1000 0001
	...
−2	1111 1110
−1	1111 1111
−0	0000 0000

1000 0000 +1

0000 0001 +1

all positive numbers begin with 0

all negative numbers begin with 1

Complement of the complement

- The complement of the complement of X is X. (X的補數)的補數 = X 本身
- $(r-1)$'s complement of $(2^n-1)-X = (2^n-1)-\big((2^n-1)-X\big) = X.$
- r 's complement of $2^n - X = 2^n - (2^n - X) = X$ if $X \neq 0$.
  - Recall that we define 2's complement of 0 as 0.

* $(r-1)$'s complement: $(r^n-1)-X$

r's complement: $r^n - X$

$\therefore$ r's complement = $(r-1)$'s complement $+1$

Representation of signed numbers

- Three possible representations of –9 with 8 bits：
  - signed magnitude: 10001001.
  - signed-1's-complement of +9 (00001001): 11110110. (r-1)'s
  - signed-2's-complement +9 (00001001): 11110111. +1 r's

(r-1)'s

r's

- Values that **can be represented** in *n* bits：
  - signed magnitude: $(-2^{n-1}+1) \sim (2^{n-1}-1)$.
  - signed-1's-complement: $(-2^{n-1}+1) \sim (2^{n-1}-1)$.
  - signed-2's-complement: $(-2^{n-1}) \sim (2^{n-1}-1)$.

Subtraction: 1's-complement numbers

減法 (r-1)'s complement

- Assume that $X, Y \geq 0$, and they have n bits (including their signs).
- **Case $X + Y$**: normal binary addition.

二進位

$$\begin{array}{r} +\ \ 9 \\ +\ 13 \\ \hline +\ 22 \end{array} \quad \Rightarrow \quad \begin{array}{r} 00001001 \\ +\ 00001101 \\ \hline 00010110 \end{array}$$

減法 (r-1)'s complement

Subtraction: 1's-complement numbers

$-7 + 4 = -3$

$2 + 4 = 6$ comp

- **Case $-X + Y$:**

$$
\begin{aligned}
&(1\text{'s complement of } X) + Y \\
&= [(2^n - 1) - X] + Y \\
&= (2^n - 1) - (X - Y).
\end{aligned}
$$

$(2^n - 1) - (X - Y) > 0$

$= 1$'s complement of $X - Y$

- **Sub-case: $X - Y \geq 0$**: there will be no carry.
- **Sub-case: $X - Y < 0$**:

$$(2^n - 1) - \underbrace{(X - Y)}_{<0} = 2^n + \underbrace{(Y - X)}_{\geq 0} - 1$$

進位的bit **carry bit**

$-6 + 8$

$3 + 8 = 11$

$+ \quad 1$

2

So there will be **a carry**. To obtain $(Y - X)$, we discard the carry and **add 1** to the result.

丟掉 2^n (進位的bit)

Subtraction: 1's-complement numbers

求 $-X+Y$

if $X-Y<0$

$$\begin{array}{r} -\ 9 \\ +\ 13 \\ \hline +\ \ 4 \end{array} \Rightarrow \begin{array}{r} 11110110 \\ +\ 00001101 \\ \hline 100000011 \\ +\ \ \ \ \ \ \ \ \ 1 \\ \hline 00000100 \end{array}$$

2^n

$(Y-X)-1$

end-around carry

→ 有進位

→ 把進位拿下來 +1

$= Y-X$

The 1's complement of 9 (00001001) is 11110110

直接反過來

求 $-X+Y$

if $X-Y \geq 0$

$(-X+Y)$

$-5+4=-1$

$$\begin{array}{r} 11111010 \\ +\ 00000100 \\ \hline 11111110 \end{array} \leftarrow X-Y \text{ complement}$$

補數

$\Rightarrow 00000001 \leftarrow X-Y$

$= 1$

$\Rightarrow Y-X=-1$

5 的 2 進位:

00000101

補數 complement

$\Rightarrow$ 11111010

Subtraction: 1's-complement numbers

- **Case $(-X) + (-Y)$:**

$$
\begin{aligned}
&(1\text{'s complement of } X) + (1\text{'s complement of } Y)\\
&\quad = [(2^n - 1) - X] + [(2^n - 1) - Y]\\
&\quad = (2^n - 1) + \underbrace{(2^n - 1) - (X + Y)}_{1\text{'s complement of } (X+Y)}
\end{aligned}
$$

進位的bit **carry bit**

extra -1

丟掉 2^n 再+1 才出現(X+Y)的補數 $= (-X-Y)$ $=$ 所求

So there will be **a carry**. If we discard the carry, then the result is the 1's complement of $(X + Y)$ minus 1. To obtain the correct result, we need to **add 1** to the result of $[-1 + (2^n - 1) - (X + Y)]$.

Subtraction: 1's-complement numbers

$$\begin{array}{r} -\ 9 \\ -\ 13 \\ \hline -\ 22 \end{array}$$

$$\begin{array}{r} 11110110 \\ +\ 11110010 \\ \hline 111101000 \\ +\qquad 1 \\ \hline 11101001 \end{array}$$

$$\begin{array}{r} +\ 9 \\ +\ 13 \\ \hline +\ 22 \end{array} \Rightarrow \begin{array}{r} 00001001 \\ +\ 00001101 \\ \hline 00010110 \end{array}$$

- Case $X - Y$ where $X < Y$:

$$\begin{array}{r} 9 \\ -\ 13 \\ \hline -\ 4 \end{array} \Rightarrow \begin{array}{r} 00001001 \\ -\ 00001101 \\ \hline \end{array} \Rightarrow \begin{array}{r} 00001001 \\ +\ 11110011 \\ \hline 11111100 \end{array} = ?\ \text{的 2' comp.}$$

1's complement

2's complement of 13

2's complement of 4

00001101

1's complement ⇒ 11110010

2's complement ⇒ 11110011 ↓+1

00000011 ↓+1

2's complement ⇒ 00000100 = 4

Subtraction: 2's-complement numbers

$X > Y$ $-5 + 3 = -2$

- Case $-X + Y$ where X ~~>~~ $<$ Y:

$$\begin{array}{r} -\ 9 \\ +\ 13 \\ \hline 4 \end{array} \Rightarrow \begin{array}{r} 11110111 \\ +\ 00001101 \\ \hline 100000100 \end{array}$$

2's complement of 9 (00001001)

discard this carryout

$5 \to 00000101$
$\to 11111010$
$+1 \to 11111011$

$$\begin{array}{r} 11111011 \\ +)\ 00000011 \\ \hline 11111110 \end{array}$$

$00000001 \leftarrow$ 1's comple
$00000010 \leftarrow$ 2's

$9 \to 00001001$
1's補數 $\to 11110110$ $+1$
2's補數 $\to 11110111$

- In general: $-X + Y = (2^n - X) + Y = 2^n - (X - Y)$.
  - Case $X > Y$: there will be 沒有進位 no carry out, and the result $2^n - (X - Y)$ is the 2's complement of $(X - Y)$.
  - Case $X \leq Y$: there will be a carry out, and the result $\cancel{2^n} + (Y - X)$ after discarding the carry out is $(Y - X)$.

Subtraction: 2's-complement numbers

- Case $-X - Y$:

$$\begin{array}{r} -\ 9 \\ -\ 13 \\ \hline -\ 22 \end{array} \Rightarrow \begin{array}{r} 11110111 \\ +\ 11110011 \\ \hline 111101010 \end{array}$$

2's complement of 22 (00010110)

9: 00001001 → 11110110 → 11110111
13: 00001101 → 11110010 → 11110011

1's → 00010101
2's → 00010110 2+4+16=22

discard this carryout

- In general, $(-X) + (-Y) \Rightarrow (2^n - X) + (2^n - Y) = \cancel{2^n} + [2^n - (X + Y)]$.
  - There will be a carry out, and the result after discarding the carry out is the 2's complement of $(X + Y)$.

Comparison of the three systems

- signed-magnitude：
  一般的 算術 尷尬的 電腦 計算
  – useful in ordinary arithmetic, **awkward in computer arithmetic**
- signed-1's-complement：
  現在 少用
  – used in old computers, but is now seldom used.
- signed-2's-complement：多數使用
  – **used in most computers.**

"—" X − Y

⇒ X + (Y's Comp.) ① ② 2's

⇒ 調整 ③ carry (+1) ② Ans Comp.

Road map

- Complements
- **Miscellaneous things**

Overflow 溢位

$$\begin{array}{r} +\,64 \\ +\,96 \\ \hline +\,160 \end{array} \Rightarrow \begin{array}{r} 01000000 \\ +\,01100000 \\ \hline 10100000 \end{array}$$

negative number, representing the 2's complement of 01100000 (96); that is, $64 + 96 = -96$! Wrong!

$$\begin{array}{r} -\,64 \\ -\,96 \\ \hline -\,160 \end{array} \Rightarrow \begin{array}{r} 11000000 \\ +\,10100000 \\ \hline 101100000 \end{array}$$

if we discard the carryout, then the result becomes a positive number 0110000 (96); that is, $-64 - 96 = +96$! Wrong!

Overflow

- The above problems (called **overflow**) are due to that using 8 bits, we can represent only $-128 \sim +127$! So the results of $64 + 96$ or $-64 - 96$ cannot be represented in a 8-bit system.
- In general, when adding two n-bits (including the sign bit) numbers X and Y, **overflow** occurs when:
  - $X, Y \geq 0$ and $X + Y > 2^{n-1} - 1$.
  - $X, Y < 0$ and $X + Y < -2^{n-1}$.
- Note that overflow cannot occur if one of X and Y is positive and the other is negative. overflow 不會發出在 X Y 一正一負的情況下

Overflow

- Overflow can be detected by examining the most significant bit of the result.

+ 64		01000000	(positive)
+ 96		+ 01100000	(positive)
+ 160		10100000	(negative)

indicate a negative number

− 64		11000000	(negative)
− 96		+ 10100000	(negative)
− 160		101100000	(positive)

indicate a positive number

Binary codes

二進制 離散的 元素

- Binary codes can be established for any set of discrete elements.

MAN (1)
WOMAN (0)

WHITE (00)
RED (01) BLUE (10)
BLACK (11)

- Using n bits, we can represent at most 2^n distinct elements.
- So, to represent m distinct objects, we need at least $\lceil \log_2 m \rceil$ bits.
  - For example, we need $\lceil \log_2 10 \rceil = 4$ bits to represent $\{0,1,\ldots,9\}$.

可表現16個 element

Alphanumeric code ASCII

- **ASCII** (American Standard Code for Information Interchange)
  - Originally using 7 bits to code 128 characters (32 are non-printing)
  - Because most digital systems handle 8-bit (byte) more efficiently, an 8 bit version ASCII has also been developed. = 1 byte

I M !

64+8+1

64+8+4+1

I	0	1	0	0	1	0	0	1	73
M	0	1	0	0	1	1	0	1	77
!									

95 printable ASCII characters, numbered 32 to 126.

Error-detecting code

資料傳輸

- Binary code that can detect errors during data transmission.
- The most common way to achieve error-detection is by means of a **parity bit**. 檢查碼
- A parity bit is an extra bit included in a binary code to make the total number of 1's transmitted either odd **(odd parity)** or **(even parity)**.

所有的bit中共有奇數個1

Odd parity

message	Parity bit
0010	0
0110	1
1110	0
1010	1

Even parity 所有的bit中共有偶數個1

message	Parity bit
0010	1
0110	0
1110	1
1010	0

Application of parity bit
